ArcGIS Enterprise 12.2

Ports used for communication between machines in the same site, portal, or individual data store.

Ports must be available on each machine. No external communication is needed.

Single direction communication between components or sites.

Inbound & outbound communication between components or sites.

1 These are the default Video Server livestream ports; the site administrator can alter them.

2 If using a cloud relational store, the hosting server communicates with the database service over the port you set for the service.

3 If using a cloud relational store, these ports are not used on the ArcGIS Data Store relational store machines.

4 Used by the queue store installed on relational store machines and needed to communicate with federated servers that use web hooks.

5 Used by the in-memory cache store that is installed on the relational store machines.

6 If you use an Amazon Web Services or Microsoft Azure cloud storage location for the object store, this machine is not present in the Enterprise deployment.
