

ArcGIS Enterprise 12.1

Ports used for communication between machines in the same site, portal, or individual data store.

Ports must be available on each machine. No external communication is needed.

Single direction communication between components or sites.

Inbound & outbound communication between components or sites.

1 These are the default Video Server livestream ports; the site administrator can alter them.

2 These ports are also needed to communicate with federated ArcGIS Server sites that use web hooks.

3 When you use ArcGIS tools to deploy on Amazon Web Services or Microsoft Azure, the object store will use a cloud service location instead of ArcGIS Data Store.
